

SEABIRD

Birds living near the sea have special adaptations, including waterproof feathers, webbed feet, and facial glands that dispose of excess salt. Seabirds hunt prey in a variety of ways: surface feeders such as albatrosses grab food while flying near the ocean's surface; aerial divers such as gannets plummet into the water from a height; surface divers such as puffins swim on the surface and plunge underwater to feed. Almost all seabirds nest in colonies, often on cliffs and other places inaccessible to predators.

WANDERING ALBATROSS
(*Diomedea exulans*)

NORTHERN GANNET
(*Sula bassana*)

KELP GULL
(*Larus dominicanus*)

MAGNIFICENT FRIGATE BIRD
(*Fregata magnificens*)

ARCTIC TERN
(*Sterna paradisaea*)

GIANT PETREL
(*Macronectes giganteus*)

ATLANTIC PUFFIN
(*Fratercula arctica*)
